SUMMARY

Computer Science student graduating in 2028, with a three-month software development internship and four applications designed, built and deployed on my own — all of them live. I work across the stack: React and Next.js in TypeScript on the front end, Node.js and Express behind it, and PostgreSQL, MongoDB or MySQL for data. I take a feature from a blank screen through to a live URL — the interface, the API calls, the database and the deploy.

EDUCATION

D. Y. Patil International University, Pune

Expected 2028

B.Tech, Computer Science & Engineering — specialisation in Cloud Computing

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL

Frontend: React, Next.js, Tailwind CSS, HTML5, CSS3

Backend: Node.js, Express, REST APIs, WebSockets / Socket.IO

Databases: PostgreSQL, MongoDB, MySQL, Supabase

Tools & Deployment: Git, GitHub Actions, Vercel, Firebase, Cloudflare, Render, Postman

EXPERIENCE

Infotact Solutions — Software Development Intern

May 2026 – Aug 2026

- Built OmniPOS, a point-of-sale and inventory system covering sales, product catalogue and stock, writing both the screens and the queries that read and update their records.
- Developed a food delivery and dine-out platform: the React front end for each screen, plus the API calls that load and save its content.
- Extracted shared components used across both projects, so repeated screens did not have to be rebuilt each time.
- Traced and cleared bugs raised in internal testing — mostly stale data after an update, and layouts breaking on small screens.
- Shipped work through Git branches and pull requests, each reviewed by a senior developer before merge.

PROJECTS

Folio — Client-Side Document Toolkit | *React, TypeScript, WebAssembly, pdf-lib, Capacitor*

folio.abhinavshukla.me · github.com/abhinavshukla19/folio

- Built five PDF and image tools that run entirely in the browser — parsing, rewriting and rendering all happen in the tab, so no file is ever uploaded and a strict Content-Security-Policy leaves the page nowhere to send one.
- Wrote the document scanner: it finds the page corners in a camera frame, solves the perspective back to a rectangle, and evens out lighting per pixel so a shadow across the paper lifts off instead of turning half the page black.
- Made photo editing non-destructive — edits are stored as descriptions and applied once against the original bitmap at export, so an image never loses a generation per adjustment. Ships as an installable PWA and an Android build.

Aureon — Video Streaming Platform | *Next.js, TypeScript, React, Supabase*

aureon.abhinavshukla.me · github.com/abhinavshukla19/Aureon-frontend

- Built a catalogue of around 40 titles across 6 category rows, verified at three widths from 360px phones up to desktop.
- Implemented two-step authentication — password sign-in followed by a 6-digit OTP emailed through Supabase, with accounts and session records stored there too.
- Virtualised the catalogue rows with react-window so long lists render only what is on screen.

Synsia — Real-Time Collaborative Editor | *React, TypeScript, Socket.IO, Node.js, MongoDB*

synsia.pages.dev · github.com/abhinavshukla19/synsia_frontend

- Built an editor where several people type into one document at the same time — edits reach every open browser over WebSockets with no page refresh, across a React client, a Socket.IO server and the database behind them.
- Fixed a bug that erased a user's work on refresh by persisting documents to MongoDB rather than holding them in socket memory.

VineVista — E-Commerce Store | *React, Express, Supabase*

github.com/abhinavshukla19/vinevista

- Launched a storefront listing 30 products across 8 categories, with search and filtering over the catalogue, a cart and order history.
- Modelled the product and stock tables in Supabase so prices and listings change without a new deploy.

ACHIEVEMENTS

- 2nd place out of 20 teams — Internal Smart India Hackathon (SIH) 2025, D. Y. Patil International University.
